

# Asymptotically bounded multifunctions and the MCP without copositivity and positive (sub)homogeneity

Fabián FLORES-BAZÁN

Universidad de Concepción, Departamento de Ingeniería Matemática, Casilla 160-C,  
Concepción-Chile; fflores@ing-mat.udec.cl

Given a multifunction  $F : \mathbb{R}_+^n \rightrightarrows \mathbb{R}^n$  and  $q \in \mathbb{R}^n$ , the multivalued complementarity problem (MCP) on the positive orthant consists in finding

$$\bar{x} \geq 0, \bar{y} \in F(\bar{x}) : \bar{y} + q \geq 0, \langle \bar{y} + q, \bar{x} \rangle = 0.$$

It is well documented that such a problem appears in many applications in Science and Engineering and therefore was the object of many investigations in the last three decades. Most of the works existing in the literature deal with the case when  $F$  is pseudomonotone (in the Karamardian sense) or quasimonotone, and only a few assume copositivity.

In this work we introduce the notion of asymptotic multifunction with respect to a class of re-scaling functions including those with slow growth, and the notion of asymptotic multifunction associated to a sequence of multifunctions rather to a single one. Based on these two concepts we establish new existence theorems for the MCP for a class of multifunctions larger than copositive without assuming positive (sub)homogeneity as in [2]. Thus we unify and generalize some of the existence results in [2, 3].

This work is partially supported by CONICYT-Chile through FONDECYT and FONDAP-Matemáticas Aplicadas II.
